Narrow Aisle Forklift Parts - Few people at the start were able to see the impact that container shipping will have in the shipping trade. One economist during the 1950s, namely Benjamin Chinitz of Harvard University, predicted that containerization will have really benefit New York, by enabling it to ship more efficiently to the southern parts of the US. He did not anticipate that containerization would also make it more inexpensive to import such products from abroad.

The majority of economic studies of containerization assumed that shipping organizations will start to replace older kinds of transportation with containerization. The studies did not predict that the process of containerization itself will result in a more direct impact on various producers, along with increasing the overall volume of trade across the world.

Containerization offers one essential benefit which is improved cargo security. The cargo is less likely to be stolen because all the products is not visible to the casual viewer. Usually, the doors of the containers are sealed and this means that any signs of tampering are more evident. There are various containers which are outfitted with high-tech electronic monitoring devices. These can be distantly monitored to detect changes in air pressure. This detection takes place when the doors are opened. These monitoring devices have reduced the "falling off the truck" syndrome that long plagued the shipping business.

In the past, there was some difficulty with incompatible rail gauge sizes in various countries. Nowadays, most shipping ports now utilize the same basic size of container that has lessened the problems. Today, nearly all rail networks across the globe operate on a 1435 mm gauge track. This is considered to be the standard gauge, although, various nations use broader gauges. Some countries in Africa and South America use narrower gauges on their networks. All of these countries depend on container trains that makes trans-shipment between different gauge trains a lot easier.
