

Truss Jibs

Truss Jib - Truss jib's could actually be utilized to be able to carry, move and position trusses. The attachment is designed to work as an extended jib additional part together with a triangular or pyramid shaped frame. Typically, truss jibs are mounted on machinery like a skid steer loader, a compact telehandler or a forklift using a quick-coupler attachment.

Older models of cranes have deep triangular truss jibs that are assembled from standard open structural shapes that are fastened with rivets or bolts. On these style jibs, there are little if any welds. Every riveted or bolted joint is susceptible to corrosion and therefore requires regular upkeep and check up.

Truss jibs are designed with a back-to-back arrangement of lacing members separated by the width of the flange thickness of another structural member. This design could cause narrow separation between the flat exteriors of the lacings. There is limited access and little room to clean and preserve them against rusting. Lots of bolts loosen and corrode inside their bores and must be changed.
